

Here is the task you need to perform for the ReactJS.

You need to create a project from scratch & need to use the redux store for the given task.  
Need to reuse the same component.

1. As per the above image initially, you need to set up a structure with header, sidebar & page view with all the pages.
2. You need to set up three pages & each page has one div with the background color. [ Color will be dynamic from the store ]
  - a. Home
  - b. About
  - c. Color
3. For the dynamic color, first, you need to redux store in which you have a color list & selected color. ( You can set any color with correct color code )

```
{
  selectedColor: {
```

```
        name: 'red',
        code: '#000000'
    },
    list: [
        {
            name: "black",
            color: "#000000"
        },
        {
            name: "white",
            color: "#ffffff"
        }
    ]
}
```

4. On all three pages, you need to fetch selected color from the store & set that color in the div as a background color.
5. In the header, you have a dropdown in which you need to show the color list & default value is selected color [ Both from the redux store ]
6. When the dropdown value change, that time in all three pages color should be updated as per the selected image.
  - a. Ex: Selected color red: Div background color is red.
  - b. Selected color green: Div background color is green.
